Minor Project -1

Cybersecurity Risk Assessment Framework for Small Businesses

- Develop a model for evaluating cybersecurity risks in small and medium enterprises (SMEs).
- Propose mitigation strategies to enhance their security posture.

Instructions

Steps:

1. **Research common cybersecurity risks** in SMEs (e.g., phishing, ransomware, insider threats).
2. **Develop a risk assessment model** (e.g., NIST Cybersecurity Framework).
3. **Create a risk evaluation metric** to rank threats based on severity and impact.
4. **Propose risk mitigation strategies** (e.g., firewalls, multi-factor authentication, employee training).
5. **Validate the model** by conducting case studies on different businesses.
6. **Document findings** and provide best practices for SME cybersecurity.

Minor Project -2

Zero Trust Architecture for Enterprise Security

- **Explore the concept of Zero Trust and how it can be implemented in corporate environments.**
- **Discuss authentication models like Multi-Factor Authentication (MFA) and role-based access control (RBAC)**

Instructions Steps:

1. **Understand Zero Trust principles (Never trust, always verify).**
2. **Define authentication models (e.g., MFA, Role-Based Access Control).**
3. **Design a Zero Trust framework with identity verification, micro-segmentation, and encryption.**
4. **Simulate an enterprise security environment using virtualization tools (VMware, Docker).**
5. **Implement access control policies using Identity & Access Management (IAM) systems.**
6. **Test security effectiveness by simulating insider and external threats.**
7. **Document results and suggest improvements**

Major Project Cyber Security

"Phishing Awareness Simulation Using Social Engineering Techniques"

Problem Statement:

Phishing attacks are one of the most common cyber threats today, exploiting human psychology to gain sensitive data. This project aims to simulate a phishing scenario in a controlled environment to understand how attackers operate and how users can be educated to avoid falling for such scams.

Objective:

- **To understand phishing techniques and simulate a realistic phishing email attack.**
- **To identify user behavior and measure awareness about phishing threats.**
- **To explore countermeasures for preventing phishing attacks.**

Instructions:

1. Research common phishing techniques (email, fake websites, etc.).

2. Design a fake but harmless email template (e.g., a fake password reset request).

3. Create a Google Form or HTML Page mimicking a login page (for demonstration only).

4. Share the email with a small test group (e.g., classmates) after informing them it's a simulation.

5. Measure how many users click, try to enter data, or report the email.

6. Analyze the results and suggest countermeasures and awareness methods.

Clues to Work On:

- **Use basic HTML/CSS for the fake webpage.**
- **Study examples from real phishing emails.**
- **Explore cyber ethics and ensure all participants give informed consent.**
- **Tools like PhishTool or even Kali Linux's SET (Social Engineering Toolkit) (optional for simulation, not real attacks).**

Naviotech
SOLUTION PVT LTD

• **Write a report on lessons learned, include screenshots, user reactions, and mitigation strategies.**

Final Deliverables

1. Screenshots:

o Fake login page

o Sent phishing email

o Click stats

2. Report:

o Introduction

o Methodology

o Results

o Lessons Learned

o Preventive Measures

3. Optional Presentation: Summary in 5–6 slides
